Summary

This report deals with the supply chain for natural gas, from the production stage, through processing and transportation, to distribution and consumption by industrial and retail customers.

It describes and explains how supply works and its key features in the European, US and Chinese markets.

It then looks at the future for natural gas, under a range of future scenarios covering then next ten years, including an optimistic scenario where increased economic activity has driven up the price of energy, a 'base' scenario of activity remaining at recent levels and a negative scenario of low economic activity and energy prices. In each case it looks at the likely structure of natural gas supply in the different regions.
