[Contactless Smart Card Market 2017](#)

A smart card is a pocket-sized card, made of plastic, which is embedded with integrated circuits or microchips. It is used for authentication, identification, data storage, and application processing. Smart cards are classified into two types: contact-based and contactless. Contactless smart cards are embedded with integrated circuits that process and store data and communicate with a terminal via radio frequencies. These cards are used by employing a radio frequency between the card and the reader that needs no physical insertion of the card. Therefore, contactless smart cards have faster applications and are user-friendly. Contactless smart cards are widely accepted and used by major sectors such as BFSI, Government, Transportation, Healthcare, and Defense.

The analysts forecast the Global Contactless Smart Card market to grow at a CAGR of 30.31 percent over the period 2015-2019.
