Ammonium sulfate $[(\text{NH}_4)_2 \text{SO}_4]$ was one of the first and most widely used nitrogen (N) fertilizers for crop production—it is used primarily where there is a need for supplemental N and S to meet the nutritional requirement of growing plants. The active ingredients in it are nitrogen and sulfur. Correct use of this fertilizer maintains healthy nitrogen levels in the soil and, in the case of alkaline soils, helps to maintain a good pH balance. When used in excess, however, it can cause a range of undesirable plant conditions, such as excessive leaf growth, weak plant bodies, and excessive thatch in lawns.
