## Industry Trends

Chronic disorders such as congestive heart failure, hypertension, and arrhythmia are becoming more common as the population ages. According to the American Heart Association's Heart & Stroke Statistics report from 2020, about 356,000 cases of out-of-hospital cardiac arrest (OHCA) occur in the United States each year, with around 90% of these being fatal. Cardiac resynchronization therapy (CRT) is a treatment that helps the heart beat in a more regular rhythm. It utilises a pacemaker to restore the heartbeat's regular timing rhythm. Over the

forecast period, the global cardiac resynchronization therapy market is expected to be fuelled by new and innovative product introductions as well as increased acceptance of cardiac resynchronization therapy defibrillators. The rising demand for cardiac resynchronization therapy products is being driven by an increase in the incidence of target disease among the older population.

Furthermore, rising expenditure by various countries on improving their existing health care infrastructure, increase in disposable income among the middle class population, and rising middle class population around the world are some other factors positively influencing the global cardiac resynchronization therapy market's development trajectory. Furthermore, companies in the global cardiac resynchronization therapy market are working hard to gain regulatory approval for their new and innovative products. For instance, in 2017, the United States Food and Drug Administration (FDA) approved Medtronic's quadripolar cardiac resynchronization therapy pacemakers, which improve therapy delivery for heart failure patients. Moreover in 2017, they were also granted CE mark authorization for their quadripolar cardiac resynchronization treatment pacemaker products.
